

T00362  
10/029,928In the Claims:

Please amend the Claims as follows:

1. (previously presented) A residential gateway that connects an Internet connection to an in-home network which comprises at least one residential device connected to the residential gateway, the residential gateway comprising:

a software module to receive control parameters from a control server via the Internet connection and cause the residential gateway to communicate with the residential device to provide control of the residential device based on the received control parameters; and

wherein the control server determines the control parameters from relevant control information accessed from one or more information servers on the Internet and state information of the residential device.

2. (original) A residential gateway that connects an Internet connection to an in-home network which comprises at least one residential device connected to the residential gateway, as per claim 1, wherein the residential device is a home irrigation system that comprises:

an irrigation controller connected to the residential gateway; and

at least one sprinkler connected to the irrigation controller.

3. (currently amended) A residential gateway that connects an Internet connection to an in-home network which comprises at least one residential device connected to the residential gateway, as per claim 1, wherein the control parameters are a water cycle of the irrigation system.

T00362  
10/029,928

4. (previously presented) A residential gateway that connects an Internet connection to an in-home network which comprises at least one residential device connected to the residential gateway, as per claim 1, wherein the control information is climatic information.
5. (cancelled)
6. (currently amended) A residential gateway that connects an Internet connection to an in-home network which comprises at least one residential device connected to the residential gateway, as per claim 3 , wherein the water cycle is also determined based on an economic setpoint.
7. (previously presented) A residential gateway that connects an Internet connection to an in-home network which comprises at least one residential device connected to the residential gateway, as per claim 1 , wherein the information server is a weather station server that stores climatic information from a plurality of weather stations.
8. (previously presented) A residential gateway that connects an Internet connection to an in-home network which comprises at least one residential device connected to the residential gateway, as per claim 2 , wherein the irrigation controller is connected to the residential gateway via an IEEE 802.11b wireless interface.
9. (original) A residential gateway that connects an Internet connection to an in-home network which comprises at least one residential device connected to the residential gateway, as per claim 1, wherein the control parameters are also determined based on an economic setpoint.
10. (previously presented) A system for providing automated control of at least one residential device connected to an in-home network, the system comprising:

T00362  
10/029,928

a residential gateway connecting the in-home network to an Internet connection;

a control server that determines control parameters for controlling the residential device, the control server determining the control parameters from relevant control information accessed from one or more information servers on the Internet and state information of the residential device; and

wherein the residential gateway comprises a software module that receives the control parameters from the control server via the Internet connection and causes the residential gateway to communicate with the residential device to provide control of the residential device based on the received control parameters.

11. (original) A system for providing automated control of at least one residential device connected to an in-home network, as per claim 10, wherein the residential device is a home irrigation system that comprises:

an irrigation controller connected to the in-home network; and

at least one sprinkler connected to the irrigation controller.

12. (currently amended) A system for providing automated control of at least one residential device connected to an in-home network, as per claim ~~10~~ 11, wherein the control parameters are a water cycle of the irrigation system.

13. (previously presented) A system for providing automated control of at least one residential device connected to an in-home network, as per claim 10, wherein the control information is climatic information.

14. (cancelled)

T00362  
10/029,928

15. (currently amended) A system for providing automated control of at least one residential device connected to an in-home network, as per claim 12, wherein the water cycle is also determined based on an economic setpoint.

16. (previously presented) A system for providing automated control of at least one residential device connected to an in-home network, as per claim 10, wherein the information server is a weather station server that stores climatic information from a plurality of weather stations.

17. (previously presented) A system for providing automated control of at least one residential device connected to an in-home network, as per claim 10, wherein the in-home network uses an IEEE 802.11b wireless interface.

18. (previously presented) A system for providing automated control of at least one residential device connected to an in-home network, as per claim 10, further comprising:

a customer computer system connected to the residential gateway to provide a user with override and control capabilities and to display current and tracked state information

19. (original) A system for providing automated control of at least one residential device connected to an in-home network, as per claim 10, wherein the control parameters are also determined based on an economic setpoint.

20. (currently amended) A method of providing automated control of at least one residential device connected to a residential gateway, the method comprising:

retrieving relevant control information from one or more information servers on the Internet;

tracking state information of the residential device;

Page 5 of 9

T00362  
10/029,928

determining control parameters of the residential device based on the tracked ~~operational~~  
state information and the retrieved control information;

communicating the control parameters to the residential gateway via an Internet  
connection;

wherein the residential gateway communicates with the residential device to provide  
control of the residential device based on the control parameters.

21. (currently amended) A method of providing automated control of at least one residential  
device connected to a residential gateway, as per claim 20, wherein the residential device is a  
home irrigation system that comprises:

an irrigation controller connected to ~~the~~ an in-home network; and

at least one sprinkler connected to the irrigation controller.

22. (currently amended) A method of providing automated control of at least one residential  
device connected to a residential gateway, as per claim ~~20~~ 21, wherein the control parameters are  
a water cycle of the irrigation system.

23. (previously presented) A method of providing automated control of at least one residential  
device connected to a residential gateway, as per claim 20, wherein the control information is  
climatic information.

24. (cancelled)

25. (currently amended) A method of providing automated control of at least one residential  
device connected to a residential gateway, as per claim 22, wherein the water cycle is also  
determined based on an economic setpoint.

T00362  
10/029,928

26. (previously presented) A method of providing automated control of at least one residential device connected to a residential gateway, as per claim 20, wherein the information server is a weather station server that stores climatic information from a plurality of weather stations.

27. (currently amended) A method of providing automated control of at least one residential device connected to a residential gateway, as per claim 20 21, wherein the in-home network uses an IEEE 802.11b wireless interface.

28. (original) A method of providing automated control of at least one residential device connected to a residential gateway, as per claim 20, wherein the control parameters are also determined based on an economic setpoint.
